# Meaningful Motion Report

Ellie Talbot July 8, 2026

## Site Details

My live motion page is at https://ellietalbot.github.io/wdd331-practice/unit-6/motion-path/index.html and the source code is at https://github.com/Ellietalbot/wdd331-practice.

## Reflection

*Write a thoughtful response to each prompt. These are not summaries of what you did. They ask you to reason about why your motion choices work the way they do and what would change if you had made different decisions.*

### Transitions and Easing

I chose an easing curve that was noticeable but not too jarring. For the buttons, I changed colors and the scale for the primary and secondary buttons; for the ghost button, I changed the color but not the scale. For the ease in and out, I had a faster ease-in to give the user more immediate feedback and then a slower ease-out to feel smooth and not too jarring. With linear, everything would be the same speed, so it wouldn't feel as smooth, and if I used transition all, it would affect things I wouldn't want to be affected.

### Keyframe Animation

The status badge communicates that the site is dynamic and makes the user feel like the site really could be live. Because the animation is subtle, it doesn't distract from important elements on the page.  Alternate direction properties matter because they tell what to do in the transition back instead of something that would be abrupt. Compositor-friendly properties matter so the page isn't being repainted over and over again.

### Reduced Motion

I used the reduce override because it was easier to add something at the end instead of restructuring all the code I had already written. The status button flashes once when reduced motion is active, but then doesn't continue after that. To verify in dev tools, I used the prefers-reduced-motion emulation.
